ZERO-HALLUCINATION AUDIT AGENT

Agentic Document Intelligence for Financial Data Extraction & Classification

Auditors get each client's fixed-asset schedules (Anlagengitter, Anlagenverzeichnis, Anlagenspiegel) as PDFs, Excel and Word files, in a new layout every time. Build an AI agent that reads them and fills our standard working file, the *Arbeitsversion*, with every figure traced to its source, and then checks its work.

YOU GET

The empty Arbeitsversion

and its output schema: one row per asset on the Anlagenverzeichnis tab, one row per asset class on the Anlagengitter tab

Synthetic hand-overs

Text PDFs, scans and Excel, with answer keys. All names and figures are invented; the layouts copy real hand-overs

The scorer

The same scorer we use for the leaderboard

RULES

01 Code has to write every figure. The model never writes a number.

02 Every value points to its source: page and box, or cell.

03 Checks need to be run to ensure accuracy and also completeness.

04 As few per-layout rules as possible: the final test uses layouts nobody has seen.

05 Read, never judge. Map the document exactly as printed; a client's broken sum is flagged, not fixed.

SCORING

+1	0	-3
Correct value	Flagged blank	Wrong value

A value whose pointer does not show it counts as wrong. The final ranking runs on a hidden test set with layouts nobody has seen.
